Available for remote work | Independently or as part of a team

PROFESSIONAL SUMMARY

Mobile developer with two years of programming study and hands-on practice through personal projects. I build Flutter applications using Dart, with experience in state management, API integration, local storage, and authentication. I focus on reusable interfaces, organized application logic, and clear handling of loading and error states. Familiar with Clean Architecture principles, I am looking for an opportunity to contribute to mobile products and grow as an engineer.

TECHNICAL SKILLS

Languages: Dart and C; practical use of Dart to implement mobile application logic and data models.

Mobile Development: Flutter, reusable widgets, screen navigation, forms, and input validation.

State Management: BLoC, event handling, and state updates for loading, success, and error scenarios.

Architecture: Clean Architecture principles, the Repository pattern for data access, and GetIt for registering and accessing dependencies.

API Integration: REST APIs, HTTP requests, JSON parsing, and conversion of server responses into structured Dart models.

Asynchronous Programming: Future, async/await, exception and network error handling.

Local Storage: SQLite for storing, retrieving, and deleting data, including offline access to previously saved history.

Authentication: Firebase Authentication for email and password registration, sign-in, sign-out, and authentication error handling.

Notifications: Integration of local notifications using flutter_local_notifications.

Development Tools: Git for version control and debugging tools to investigate application behavior, identify problems, and fix issues.

PERSONAL PROJECTS

Weather App - A Flutter app for searching current weather by city through a REST API. Uses BLoC for state management and GetIt for dependencies. Saves weather history in SQLite for offline access and handles network errors.

Pizza Delivery App - A Flutter app with a pizza catalog, cart, and order placement. Uses BLoC and Firebase Authentication for state management and email/password sign-in. Simulates delivery stages with timers and displays local delivery notifications.

PROFESSIONAL STRENGTHS

I communicate clearly, connect easily with others, and welcome constructive feedback. I am available for remote work, both independently and as part of a team. I am eager to learn new technologies every day, strengthen my technical skills, and apply new knowledge to practical development tasks.
